### *Smartphones*

*(2A.) Smartphones runs on mobile operating system that allows that basic features as text messages, call, video chat, gps navigational devices, video camaras, media players, and digital cameras. It's purpose to help people with many things. For Example on the smartphone there's an app where you are able to time manage aslo your hours in the day so you have something to do or success. It's highly effect in a positive way it helps with performance task if your desire is to get fit for your body or your an athlete trying to get better on the offseason or trying to maintain a balanced diet.*

*(2B.) First I brainstorm my idea about artifact. I researched smartphone how they operate for a good hour in the block day. Some things you can set up in advance and then show them later if necessary, while other things like navigating around the phone and downloading apps are*

*probably best demonstrated in person. **Enable Find My Phone.** During the setup process in iOS, make sure you choose yes to activating Find My iPhone. Android users can go into the Google Settings app and Android Device Manager to enable remote wipes. Both of these will help locate the phone if it gets stolen or, perhaps more likely, lost under a seat cushion.*

*(2c.) One benefit to smartphones is decade ago you needed seven things to complete your daily activities such as pager, cell phone, pda a palmtop computer that functions as a personal organizer but also provides email and Internet. might also need an MP3 player, an e-book reader, a camera and a GPS device. Through miniaturized hardware that packs a processor, speakers, a camera, a GPS receiver, a Wi-Fi adapter and a high definition touch-sensitive screen into a cell-phone-sized device, a smartphone puts all of this functionality into your pocket. One of your workers can easily search for directions to a client's business, read a sales flier before a meeting starts and transmit an ad sale to your office from via a mobile hotspot. Now you don't all of that because apple minimize all of that into the iphone . Negative effect , Children are learning how to use and even getting their own smartphones younger and younger age. Research found that Couples are sitting at the same table and not speaking to each other. Families sit in separate rooms all on different devices doing their own thing. We all know how important human contact is and when that is removed and replaced by virtual contact, something is lost. Many employees*

*never really leave the office as all their emails are on their phone and they can access their work from anywhere. They never take the time off to unwind, vacation, and even spend time with their friends and family. Many people, especially those of younger generations, say that they "couldn't live without their phones."*

*(2d.) For his smartphones the data storage is already in the phone. The inputs of these devices are include keyboard, a mouse, microphone, and a webcam. Outputs are include speakers, monitors, and printers. These inputs and outputs what make the iphone and samsung much better than the original phone. Allows more access to better things.*
